

Activity 7 - Apply stock movements with enums and match

AI Vibe Coding with Rust / TGS-2023039924 / version 3.0 / K3/A3

Specification

Movement::{Receive(u32), Ship(u32), Adjust(i64)}. apply(stock, movement) -> Result<u32, StockError>: shipping more than available is Insufficient; results below zero are NegativeResult; above u32 are Overflow. apply_all stops at the first error.

Plan before code

Act as a senior Rust reviewer. Specification: Movement::{Receive(u32), Ship(u32), Adjust(i64)}. apply(stock, movement) -> Result<u32, StockError>: shipping more than available is Insufficient; results below zero are NegativeResult; above u32 are Overflow. apply_all stops at the first error. Before writing any code, list the public signatures, the edge cases and at least four boundary tests you would expect. Ask me about anything ambiguous.

Generate with AI

Implement "Apply stock movements with enums and match" in starter/src so that the supplied tests pass. Use enum + match with exhaustive arms; no wildcard _ arm that hides future variants. Keep public signatures unchanged, use no unsafe code, and explain each design decision in one sentence.

Repair from evidence

Here is my exact cargo output: <paste the first error or failing test>. Explain the cause in plain English, propose the smallest fix that keeps the specification, and add one regression test. Do not change expected values in existing tests.

Review checklist

Signatures unchanged; no unsafe; no unwrap() on input; no new crates; every boundary tested; cargo test, clippy -D warnings and fmt --check pass; you can explain every line.
