

Activity 11 - Debug a failing integration with tests

AI Vibe Coding with Rust / TGS-2023039924 / version 3.0 / K4/A4

Specification

`summarise(csv, threshold) -> Result<Summary, String>` where `Summary { lines, total_cents, low_stock }`. Every line counts towards the total; low stock is strictly below the threshold, sorted by SKU; malformed lines are `Err("line N: ...")`.

Plan before code

Act as a senior Rust reviewer. Specification: `summarise(csv, threshold) -> Result<Summary, String>` where `Summary { lines, total_cents, low_stock }`. Every line counts towards the total; low stock is strictly below the threshold, sorted by SKU; malformed lines are `Err("line N: ...")`. Before writing any code, list the public signatures, the edge cases and at least four boundary tests you would expect. Ask me about anything ambiguous.

Generate with AI

Implement "Debug a failing integration with tests" in `starter/src` so that the supplied tests pass. Give the AI the failing test output and the function only; ask for a diagnosis before any code change. Keep public signatures unchanged, use no unsafe code, and explain each design decision in one sentence.

Repair from evidence

Here is my exact cargo output: `<paste the first error or failing test>`. Explain the cause in plain English, propose the smallest fix that keeps the specification, and add one regression test. Do not change expected values in existing tests.

Review checklist

Signatures unchanged; no unsafe; no `unwrap()` on input; no new crates; every boundary tested; cargo test, `clippy -D warnings` and `fmt --check` pass; you can explain every line.
